

Software engineering for agencies

A development practice that operates as an invisible extension of your team. We build the software your clients need while you own the relationship.

A software practice built for how agencies actually work

We started Ragen after watching too many agencies struggle with the same problem: great client relationships, not enough engineering capacity to deliver at the pace those clients expect.

Ragen solves this by operating as a dedicated development arm for digital agencies, design studios, and consulting firms. We handle the full engineering cycle — architecture, development, testing, deployment, and maintenance — while your team stays focused on client strategy, design direction, and business development.

We are deliberately small. Every engineer on a Ragen project brings at least five years of production experience. We hire for technical judgment and communication ability. No juniors learning on client work. No account managers padding estimates. Just senior engineers who understand both code and context.

Our model is designed around long engagements. The average client relationship runs three years. We measure success by retention — how many clients stay with us past the first project — not by quarterly growth metrics. Currently, that number is 11 out of 12.

We operate white-label by default. Your clients never see our name. Repos sit in your GitHub organization. Deployments run on your infrastructure. Client communication goes through you. We exist to make your agency more capable, not to build our own brand.

11 of 12

clients stay with us past the first project

What we build and the technologies we use to build it

01

Web application development

Full-stack platforms, SaaS products, admin dashboards, and customer portals. React, Next.js, TypeScript on the frontend. Node.js or Python on the backend. PostgreSQL for persistence. Architecture scoped to the actual problem, not what's trending.

02

Mobile applications

iOS, Android, and cross-platform apps with React Native. Full lifecycle from architecture through App Store submission and post-launch maintenance. Most projects are companion apps to larger web platforms.

03

Backend & API engineering

REST and GraphQL APIs, microservices, event-driven systems, database design. Platforms handling millions of daily requests. Performance and observability treated as first-class concerns.

04

AI & automation

LLM integration, RAG pipelines, document processing, intelligent agents, workflow automation. We treat AI as an engineering discipline — the hard part is productionizing it reliably.

05

SaaS product development

End-to-end builds: multi-tenant architecture, Stripe billing, user management, analytics. The operational tooling that turns a prototype into a software business.

06

UI/UX design & development

Design-to-code with meticulous attention to motion, states, responsive behavior, and accessibility. Production-ready output from your Figma files. Not "close enough."

07

Cloud infrastructure & DevOps

AWS architecture, Docker, Kubernetes, CI/CD with GitHub Actions, Terraform, monitoring with Datadog or Grafana. Designed for reliability and reasonable cost.

08

Platform integrations

CRM, payment gateways, ERPs, third-party APIs. We handle edge cases, rate limits, webhook reliability, and data consistency — the parts that make integrations genuinely hard.

09

Blockchain & Web3

10

Custom enterprise software

Eight things that make the partnership work

Senior-only teams

Everyone writing code on your project has shipped production software before. No exception. This means fewer mistakes, better architecture, and less rework. Junior developers learn elsewhere — not on your timeline.

White-label by default

Client meetings happen through you. Repos are in your GitHub org. Deploys go to your infrastructure. Our name appears nowhere on anything your client sees. We are invisible by design.

Predictable velocity

Two-week cycles with demonstrable output at the end of each. No "95% done" status updates that drag on for weeks. You see working software, not progress reports.

Security as a habit

OWASP awareness, dependency audits, secure auth flows, proper secret management. Security is continuous discipline, not a pre-launch checklist item.

Direct engineer access

You talk to the people building your product. No account managers filtering information. No project managers padding estimates. Direct, technical conversations that move work forward.

Long-term thinking

We optimize for maintainability two years out. Documentation, tests, and clear architecture aren't extras — they're how we avoid the technical debt that makes software expensive to change.

Business-aware engineering

We ask why before how. Understanding the business context helps us make better technical trade-offs. Sometimes the right answer is less code, not more.

Written culture

Architecture decisions, trade-offs, and technical discussions are documented in writing. Institutional knowledge stays with you even if individual engineers rotate. No single points of knowledge failure.

How an engagement works, from first call to ongoing support

1

Discovery & scoping

Two or three conversations to understand what you're building, why, and for whom. We ask about business constraints, not just technical requirements. Output is a scoping document with milestones — not a 60-page spec nobody reads.

2

Architecture & design alignment

Before writing code, we align on database schema, API surface, component structure, and deployment strategy. We review your design work for implementation feasibility.

3

Development sprints

Two-week cycles ending with a demo of working, deployable software. You get Slack access to see progress, ask questions, and course-correct in real time. No status meetings required.

4

Review & refinement

Every PR reviewed by another engineer before merging. We test for functionality, performance, security, and edge cases. QA is part of development, not a separate phase.

5

Deployment & handover

We deploy to your infrastructure. CI/CD is configured for automated future deployments. Documentation, runbooks, and architecture diagrams included. Your team — or any future team — can pick up where we left off.

6

Ongoing support

Most clients keep us on retainer after launch. Bug fixes, features, performance improvements, dependency upgrades — the steady work of keeping software healthy over time. Flexible and responsive.

The tools we reach for by default — and we deviate when a project calls for it

Domains where we've built enough experience to add strategic value

01

Financial services & fintech

Portfolio management, compliance systems, payment integrations, financial data platforms. We understand the regulatory weight fintech projects carry.

02

Healthcare

Patient management, telehealth, scheduling, HIPAA-compliant data handling, EMR integrations. Healthcare software is hard because the stakes are high.

03

E-commerce & retail

Custom storefronts, headless Shopify, inventory management, multi-vendor marketplaces, personalization engines. Systems handling millions in monthly GMV.

04

SaaS

Multi-tenant platforms, subscription management, user analytics, onboarding flows, operational backend. Most clients are SaaS companies or agencies building SaaS.

05

Logistics & supply chain

Route optimization, warehouse management, real-time tracking, fleet dashboards, EDI integrations. Unsexy problems with enormous ROI when solved well.

06

Education & edtech

Learning management, assessment platforms, student portals, content delivery. Built for institutions serving thousands of concurrent users at peak.

07

Real estate & property

Property listing platforms, tenant management, maintenance workflows, document automation, CRM integrations for brokers and property managers.

08

Professional services

Client portals, project management, time tracking, invoicing, resource planning for law firms, consultancies, and accounting practices.

Selected projects. Names withheld; details are real.

Multi-tenant SaaS platform for a legal-tech company

REACT · NODE.JS · POSTGRESQL · AWS · STRIPE

A US-based legal-tech startup needed a document automation platform serving individual law firms, corporate legal departments, and legal aid organizations — each with distinct feature sets, pricing, and compliance requirements. Their prototype was single-tenant and capped at three pilot customers. We rebuilt the platform with multi-tenant architecture, role-based access control, document generation pipelines, and Stripe subscription management. Eight months from architecture to launch.

30+ paying customers in six months. Zero downtime in the first year. 4,200 documents processed per business day.

Mobile banking experience for a European fintech

REACT NATIVE · PYTHON · DJANGO · KUBERNETES · PLAID

A Berlin fintech needed an iOS and Android banking app with account aggregation, spending analytics, and savings goals. Backend integrated with Plaid for US connectivity and Open Banking APIs for Europe. Tight regulatory deadline. We built the React Native app and aggregation backend in parallel. First App Store version shipped in 14 weeks.

12,000 downloads in Q1. 4.6 App Store rating. Client raised Series A four months post-launch, citing mobile as the primary growth driver.

Supply chain visibility platform for a logistics company

NEXT.JS · GO · POSTGRESQL · DOCKER · ELASTICSEARCH

A logistics firm needed to replace a legacy desktop app with a modern web platform for real-time shipment tracking, route optimization, and exception management. The system ingests data from 14 carrier APIs, normalizes it, and presents a unified view. We built the ingestion pipeline in Go and the dashboard in Next.js.

6x improvement in exception response time. 3,500+ shipments tracked daily. 70 hours per week saved in manual data entry across operations.

What clients say after working with us

“We brought Ragen in after two failed attempts with other dev shops. The difference was immediate — they asked questions nobody else had asked, pushed back when our timelines were unrealistic, and delivered working software every two weeks without exception. Two years later, they’re still our primary development partner.”

Design agency founder
New York, 3-year engagement

“They act like they work here. They’re in our Slack, they join our planning sessions, they understand our business context. But my clients have no idea they exist — which is exactly how I need it. Code quality is consistently high. When there’s a production issue, they respond faster than some of my in-house people.”

CTO, SaaS startup
London, 2-year engagement

“I was skeptical about outsourcing. Every founder has a horror story. Ragen is the first external team I’ve worked with where I didn’t feel like I was constantly managing them. They estimate conservatively and deliver on time. When something takes longer, they tell me early, not after the deadline. That honesty is rare.”

CEO, fintech company
Berlin, 18-month engagement

“We’re a design studio without in-house engineering. Ragen handles all development across web and mobile. Our designers hand off Figma files and Ragen returns production code that actually matches the designs. It sounds simple. It’s not. Most dev teams can’t do it. Ragen can.”

Creative director, brand studio
San Francisco, 2.5-year engagement

MODEL 01

Fixed scope

For well-defined projects with clear requirements and a deadline. We scope together, agree on deliverables and timeline, and deliver against that scope.

Milestone-based payment. Changes handled through a straight-forward change order process.

MODEL 02

Dedicated team

For ongoing product work where scope evolves. A stable engineering team operating as your development arm. Monthly flat rate. You prioritize the backlog; we deliver in two-week cycles. Minimum three-month commitment.

MODEL 03

Monthly retainer

For post-launch support and incremental improvements. Fixed monthly capacity for bug fixes, minor features, performance work, and dependency management. No minimum commitment. Combines with either model above.

Let's talk about what you're building.

We take on a limited number of engagements each quarter. If you need senior engineering capacity, the first conversation is just that — no pitch, no pressure.

hello@ragen.dev · ragen.dev

We respond within one business day. A brief description of your project and timeline helps us prepare for the conversation.
